ad V.

1. D1, in particular page 5, lines 1-23 and claim 1, discloses a method for facilitating the identification, authentication and quality control of products wherein in a first phase a product is analysed and the result of the analysis is processed and stored on a data carrier e.g. in the form of a bar code (cf. figure 1). The data carrier is fixed on the container of the product (cf. page 4, lines 49-55). In a second phase the data of the data carrier is read by a reading device. If it cannot be assured that the product is still the same as in the first phase, the product is anew analysed.
2. D1 does not clearly disclose that in the second phase the result of the second analysis is compared with the read data. It also appears that it is not evident to compare the new result with stored data, since the new analysis is only made if reading shows that the stored data might be wrong. It appears therefore that the subject-matter of claim 1 meets the requirements of Article 33(2) and (3) PCT. This applies likewise to the corresponding system claim 18.
3. Independent method claim 16 is not new, because the marking method is known from D1, cf paragraph 1 above.
4. The marked packed product of claim 21 is likewise known from D1, cf paragraph 1 above.
